

Tokun — Cashfree Easy Split vs Razorpay Route

A side-by-side reference, based on the same live testing we just did against Razorpay Route.

1. Quick Verdict

	Razorpay Route	Cashfree Easy Split
Vendor/seller onboarding	4 separate calls (Account → Stakeholder → Product Config → Settlement Update)	1 single call creates vendor + bank + KYC together
KYC verification path	Can be instant via CKYC (if seller's PAN has an existing central KYC record) — otherwise document upload + Video KYC	Always requires document upload + manual "operations team" review — no automated fast-path found
Splitting a payment	Specified at order-creation time (<code>transfers</code> array)	Can be done after payment too, via a separate "Split After Payment" call — more flexible timing
UPI settlement for seller	Not supported (bank account only)	Vendor object has an explicit <code>upi</code> field alongside <code>bank</code> — worth confirming, may support UPI
Integration friction (from what we hit)	High — several undocumented required/forbidden fields discovered only via trial and error	Unknown yet — request shape looks simpler and more complete in one call, but hasn't been tested live

Important caveat: Everything below is from documentation only — none of this has been tested against a live Cashfree sandbox account the way Route was. Route also looked simple on paper before we hit ~6 rounds of undocumented gotchas in practice. Treat this as a starting point, not a guarantee it will be smoother in practice.

2. Cashfree Easy Split — Vendor Onboarding (1 call)

Endpoint

Sandbox: `POST https://sandbox.cashfree.com/pg/easy-split/vendors`

Production: `POST https://api.cashfree.com/pg/easy-split/vendors`

Headers

```
x-api-version: 2026-01-01
x-client-id: <your client id>
x-client-secret: <your client secret>
Content-Type: application/json
```

Request Body

```
{
  "vendor_id": "seller_12345",
  "status": "ACTIVE",
  "name": "Suresh Kumar",
  "email": "suresh@example.com",
  "phone": "9000090000",
  "verify_account": true,
  "dashboard_access": true,
  "schedule_option": 1,
  "bank": {
    "account_number": "1122334455",
    "account_holder": "Suresh Kumar",
    "ifsc": "ICIC0001234"
  },
  "kyc_details": {
    "account_type": "INDIVIDUAL",
    "pan": "ABCPE1234F"
  }
}
```

Notice: bank details AND PAN are in the *same* call — no separate "stakeholder" step, no separate "product configuration" step, no separate "settlement update" step. This is the core simplification vs. Route's 4-call flow.

Response

```
{
  "vendor_id": "seller_12345",
  "status": "IN_BENE_CREATION",
  "bank": { "account_number": "...", "account_holder": "...", "ifsc": "..." },
  "kyc_details": { "account_type": "INDIVIDUAL", "pan": "..." },
  "schedule_option": { "settlement_schedule_message": "T+1 settlement at 11:00 AM", ... }
}
```

Status starts as **IN_BENE_CREATION** — moves to **Completed** once Cashfree's operations team verifies the KYC (per their KYC docs, this is a manual document-review step, not instant).

3. Splitting a Payment

Option A — Split specified upfront (comparable to Route's **transfers**)

Reference the **vendor_id** and split percentage/amount when creating the order.

Option B — Split After Payment (Route has no equivalent for this)

POST https://sandbox.cashfree.com/pg/easy-split/orders/{order_id}/split

Collect the full payment first (nothing split yet — money sits with Cashfree/your account), then trigger the split explicitly whenever you're ready. For Tokun's hire/service escrow flow, this is arguably a more natural fit than Route's `on_hold` flag — the "hold" is implicit (split simply hasn't been triggered yet) instead of an explicit flag to set and later flip.

4. KYC — Individual vs Business

account_type	Required documents
INDIVIDUAL	PAN + one address proof (Aadhaar, Driving License, Passport, or Voter ID)
BUSINESS	PAN + GST/CIN (as applicable) + same address proof options

No CKYC fast-path found in Cashfree's docs — unlike Razorpay, where a seller with an existing Central KYC record can get instant automated verification. Cashfree's stated statuses (`Document not shared` → `In Document Review` → `Completed`) imply a human-reviewed process every time. This could mean **slower onboarding per seller** than Route's best case, even though the initial API call is simpler.

5. What We Don't Know Yet (needs live sandbox testing to confirm)

- Exact turnaround time for vendor KYC approval in practice
- Whether the `upi` field on the vendor object is actually usable for settlement (would solve the UPI-only-seller gap Route can't handle)
- Whether Cashfree also gates this feature behind a business-eligibility/activation request like Razorpay Route's RBI-driven turnover check, or if it's available immediately on signup
- Real error messages and undocumented required fields — every gateway has some; we only found Route's by testing live

6. Recommendation

Given how far along the Route integration already is (Account + Stakeholder steps confirmed working, only Product Config/Settlement left), **finishing Route first** is still the pragmatic choice — switching now discards that progress for an alternative with its own unknown rough edges. Keep this document as a reference if Route's remaining steps turn out to be a dead end, or if a future need (e.g., UPI-only sellers) makes Cashfree's simpler single-call vendor model worth revisiting.

Based on Cashfree's public API documentation as of early August 2026, not yet verified against a live sandbox account. Field names, KYC turnaround, and eligibility requirements should be re-confirmed directly with Cashfree before committing to a switch.
